

*The protection of our environment*

*is our central concern and an essential contribution to the success of Euroclima.*

*In cooperation with our employees, neighbours, customers, suppliers and all other stakeholders we include all aspects of environmental protection, sustainable use of resources and preventive measures in all fields of activities.*

We work in accordance with the following principles:

Our company is located in an intact environment.

Through our sustainable actions, we make an important contribution, to ensuring that future generations will have the same living conditions, as we have today.

The environmental protection is one of our greatest concerns.

We have established an environmental management system in our companies EUROCLIMA AG Brunico and EUROCLIMA Ges.m.b.H Sillian.

We commit us to continuously improve our environmental management system and thereby also our contribution to the environment. The Euroclima management verifies the relevance, implementation, efficiency and compliance of the environment policy targets. For this verification we consider all internal and external influencing factors on the company.

Our employees' sense of responsibility for the environment is promoted by training and leading by example.

We analyse all environmental aspects, their causes, their consequences and improve them.

We avoid environmental pollution.

In cooperation with customers, employees, suppliers and the society, we comply with and improve the health, safety and environmental standards.

It is possible to completely disassemble our products into the primary materials.

The economical use of resources is important for us.

One main focus is the waste avoidance and separation.

We produce a big amount of our energy demand with our photovoltaic power plants, solar collectors and our geo-thermal heat pump.

Our Air Handling Units, that include heat- and refrigeration recovery systems, help our customers to reduce their energy requirements.

As one of few manufacturers, we offer all major recovery systems in our product range.

The focus of our development activities lies on developing new units and improving existing ones, as environmentally-friendly and energy-efficient as possible.

Our environmental performances are presented transparently.

We consider the compliance with all binding commitments.

With the implementation of the environmental management system in accordance with ISO14001, we ensure additional activities.

All required resources for all these activities are provided.
